Full-body multichannel interaction  
for therapy and learning with  
autistic children

Polisocial Award

## Full-body multichannel interaction for therapy and learning with autistic children

The project aims at developing and evaluating, in collaboration with therapeutic centers devoted to children with intellectual disability (autism, in particular), innovative interactive tools that exploit motion recognition technology and "full-body" interaction with robot and visual interfaces on medium-large screen, in order to promote cognitive, motor, and social skills.
